

How Ambient works

Your bet appears on your phone's lock screen the way a flight or a food delivery does — **and most of the time, we say nothing at all.**

The whole idea in one picture

Something happens in a match. Before anything reaches the customer, it passes four questions. Fail any one of them and nothing happens — which is the normal outcome, by design.

The order is deliberate. Safety is checked first — before we even ask whether the moment is interesting — so a customer taking a break can never be reached, whatever else is true.

What changes for the customer

Today

- The app exists only while it's open
- Marketing decides what to send, and when
- The same message goes to everyone
- Alerts get ignored, then switched off — usually for good
- Customers follow their own bets in someone else's app

With Ambient

- Their bet is visible without unlocking the phone
- The moment decides — a goal that changes their slip
- Each customer's own bet, in their own language
- Alerts stay rare, so they stay switched on
- The live moment happens on our screen

Why this is worth doing

MORE VISITS, NO EXTRA NOISE

4x

A glance at the lock screen is a reason to open the app that costs the customer nothing. We reach them on the days they'd otherwise never open it.

PERMISSION STAYS ALIVE

1/day

Customers switch alerts off because there are too many. Keep them rare and they stay on — and every other surface depends on that.

NOTHING LEAVES THE PHONE

€0

All the personalisation happens on the device, so there's no new server to build, no per-customer sending, and no personal data in transit.

Every surface shows the customer something they already chose — their bet, their team, a real kickoff time. Never an offer, never a price, never "bet now". That keeps it on the right side of every market we operate in, and it is why the design still works after the advertising rules tighten again.

Where it will not go

The lock screen and the home screen never carry a promotion. Bonuses and offers stay inside the app, behind their own permission, and are never shown to a customer who is taking a break or close to their own limit. That is built into how the system works, not a rule someone has to remember to follow.
